Background Information

GUCY2F (Guanylate cyclase 2F, retinal) is also named as GUC2F, RETGC2 and belongs to the adenylyl cyclase class-4/guanylyl cyclase family. GUCY2F may play a specific functional role in the rods and/or cones of photoreceptors. It may be the enzyme involved in the resynthesis of cGMP required for recovery of the dark state after phototransduction. By in situ hybridization, mRNA encoding GUCY2F is found only in the outer nuclear layer and inner segments of photoreceptor cells. By using synthetic peptide antiserum specific for each RetGC subtype, RetGC-2(GUCY2F) can be distinguished from RetGC-1 as a slightly smaller protein in immunoblots of bovine rod outer segments.(PMID:777544).
