Background Information

Ubiquitin (Ub) is a small, highly conserved eukaryotic protein that has an essential role in diverse cellular signaling pathways, including targeting proteins for proteasomal degradation. Cellular Ub is comprised of two distinct pools consisting of free Ub and Ub-substrate conjugates. UbC is a polyubiquitine gene that encodes Ub polyprotein. UbC, as stress-inducible polyubiquitin precursor proteins of around 9-11 monomers, is cleaved into monomeric ubiquitin by cellular deubiquitylating enzymes.
