Background Information

Human CLE/C14orf166 protein is a positive modulator of cellular RNA polymerase. CLE is also shown to interact with the influenza virus polymerase complex and colocalizes with viral ribonucleoproteins, and is required for viral replication. Similarly, CLE is identified as a novel host interacting partners of the mature hepatitis C virus core protein. CLE levels were significantly higher in the serum of patients with PaCa compared with the control group was strongly expressed in tumor cells, suggesting that C14orf166 may be a potential biomarker of pancreatic adenocarcinoma.
