Background Information

RBM5, also named as RNA-binding protein 5, is a 815 amino acid protein, which contains 2 RRM (RNA recognition motif) domains and belongs to the RBM5/RBM10 family. RBM5 localizes in the nucleus and is a component of the spliceosome A complex. RBM5 regulates alternative splicing of a number of mRNAs and may modulate splice site pairing after recruitment of the U1 and U2 snRNPs to the 5' and 3' splice sites of the intron. RBM5 may both positively and negatively regulate apoptosis by regulating the alternative splicing of several genes involved in this process, including FAS and CASP2/caspase-2. The phosphorylation of RBM5 protein would influence the detected molecular weight. A 105-110 kDa band was also reported (PMID: 27957556).
