Background Information

MBNL1 (muscleblind-like 1) is one of the MBNL proteins containing 3 members (MBNL1-3) in vertebrates. And MBNL1 is widely expressed in adult tissues including brain, heart and skeletal muscle (PMID:25274774). As a highly conserved RNA-binding protein, MBNL1 regulates alternative splicing, alternative polyadenylation, mRNA stability and mRNA localization in the nucleus. The neurological diseases DM1 and DM2 (myotonic dystrophy type 1 and DM2 (myotonic dystrophy type 1 and DM2 (myotonic dystrophy type 1) and DM2 (myotonic dystrophy type 2) and DM2 (myotonic dystrophy type 3) and DM2 (myotonic dystrophy type 3) and DM2 (myotonic dystrophy type 3) and DM2 (myotonic dystrophy type 4) type2) are caused by expansion of repetitive sequences in non-coding regions in the DMPK gene because of the inappropriate patterns of alternative splicing owing to MBNL1(PMID:24354850). The antibody could recognize the common full-length protein in applications.
