Informations générales

FLT3 interacting zinc finger 1 (FIZ1) is a ubiquitous expressed protein that composes of 11 C2H2 zinc finger domains spread over the entire protein in clusters of two, three, or four fingers. The interaction of FIZ1 was mapped to the catalytic domain of FLT3, which is a receptor tyrosine kinase involved in proliferation and survival of hematopoietic progenitor cells as well as differentiation of early B lymphoid progenitors (10409713). In the mammalian retina, FIZ1 interacts with NRL (Neural-Retina Leucine-zipper), an essential transcriptional activator of rod photoreceptor-specific genes, and the concentration of FIZ1 in the retina will increase during photoreceptor terminal maturation (18854042).
