## Informations générales

PEAK1, also named as SGK269 and KIAA2002, belongs to the protein kinase superfamily. (PEAK1). It is a 190-kDa nonreceptor tyrosine kinase that localizes to actin filaments and focal adhesions. PEAK1 undergoes Src-induced tyrosine phosphorylation, regulates the p130Cas-Crk-paxillin and Erk signaling pathways, and operates downstream of integrin and epidermal growth factor receptors (EGFR) to control cell spreading, migration, and proliferation. Perturbation of PEAK1 levels in cancer cells alters anchorage-independent growth and tumor progression in mice. Notably, primary and metastatic samples from colon cancer patients display amplified PEAK1 levels in 81% of the cases. PEAK1 is an important cytoskeletal regulatory kinase and possible target for anticancer therapy. This antibody is specific to PEAK1.
