Background Information	Dyneins are a group of microtubule-activated ATPases that serve to convert chemical energy into mechanical energy. It can be divided into 2 large subgroups, namely, the axonemal and cytoplasmic dyneins. The conventiona cytoplasmic dynein are comprised of 2 heavy chain polypeptides and a number of intermediate and light chains. DYNC1H1 is a cytoplasmic dynein and belongs to the dynein heavy chain family. It acts as a motor for the intracellular retrograde motility of vesicles and organelles along microtubules. DYNC1H1 has been implicated in the degeneration of dopaminergic neuron axons and motor neurons in PD patients

Various lysates were subjected to SDS PAGE followed by western blot with 12345-1-AP (DYNC 1H1 antibody) at dilution of 1:6000 incubated at room temperature for 1.5 hours.

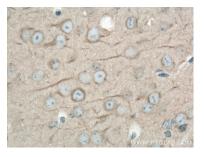

HeLa cells were subjected to SDS PAGE followed by western blot with 12345-1-AP (DYNC1H1 antibody) at dilution of 1:500 incubated at room temperature for 1.5 hours.

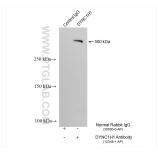

Immunofluorescent analysis of MCF-7 cells, using DYNC1H1 antibody 12345-1-AP at 1:50 dilution and Rhodamine-labeled goat anti-rabbit IgG (red). Blue pseudocolor = DAPI (fluorescent DNA dye).
