Background Information

The retinal pigment epithelium (RPE) has a essential role in maintaining visual function and dedifferentiation of RPE contributes to the pathophysiology of several ocular diseases[PMID: 22523078]. Microphthalmia-associated transcription factor (MITF) is a key regulator of RPE differentiation that is also down-regulated in dedifferentiated hRPE cells. MITF is a basic helix-loop-helix (hHLH)-leucine zipper protein that involves in the development of various cell types, including neural crest-derived melanocytes and optic cup-derived retinal pigment epithelial cells [PMID: 10578055].

Selected Validation Data

Various lysates were subjected to SDS PAGE followed by western blot with 13092-1-AP (MITF antibody) at dilution of 1:1500 incubated at room temperature for 1.5 hours.

FC result of anti-MITF (13092-1-AP, 1:50) with hESC which spontaneous differentiation toward retinal lineage (RPE). (Black: control; Red MITF).

IP result of anti-MITF (IP:13092-1-AP, 4ug; Detection:13092-1-AP 1:1000) with mouse heart tissue lysate 4000ug.
