Background Information

Alpha-N-acetyl-neuraminy-2,3-beta-galactosyl-1,3-N-acetyl-galactosaminide alpha-2,6-sialyltransferase (also known as ST6GALNAC4) is a member of the sialyltransferases, which catalyzes the transfer of sialic acid from cytidine monophosphate (CMP)-sialic acid to galactose-containing substrates. ST6GALNAC4 may be induced abnormal TGFBR2 glycosylation, resulting in the higher protein levels of TGFBR2 and TGF pathway increased activation (PMID: 37381011, 37034303). ST6GALNAC4 was reported to influence patient prognosis though subverting immunosurveillance in Chronic lymphocytic leukemia.
