Background Information

Ribosomal protein S6 (RPS6), also named as Phosphoprotein NP33, may play an important role in controlling cell growth and proliferation through the selective translation of particular classes of mRNA. Ribosomal protein S6 is the major substrate of protein kinases in eukaryote ribosomes. The phosphorylation is stimulated by growth factors, tumor promoting agents, and mitogens and is dephosphorylated at growth arrest.

Selected Validation Data

Serum-free treated NIH/3T3 cells and 10 % fetal bovine serum treated NIH/3T3 cells were subjected to SDS PAGE followed by western blot with 29220-1-AP (Phospho-S6 Ribosomal protein (Ser240/244) antibody) at dilution of 1:3000 incubated at 4°C overnight. The membrane was stripped and reblotted with GAPDH antibody as loading control.
