Background Information

The cell division cycle 25 (CDC25) family of proteins are highly conserved dual specificity phosphatases that activate cyclin-dependent kinase (CDK) complexes, which in turn regulate progression through the cell division cycle. CDC25C (cell division cycle 25 homolog C) is one of the 3 isoforms of CDC25 in mammalian cells. It is present in the cytoplasm of asynchronously growing human cells (PMID:10330186). And it may be phosphorylated by its own substrate, an active cdc2-cyclin B complex, to create an autoactivation loop (PMID:7937793). It can be hyperphosphorylated to get the active form of 70 kDa (PMID:18296513). CDC25C has some isoforms with molecular mass of 46-53 kDa.

Selected Validation Data

1X10⁶ K-562 cells were intracellularly stained with 0.2 ug Anti-Human CDC25C (66912-1-Ig, Clone:2B6B12) and CoraLite® 488-Conjugated AffiniPure Goat Anti-Mouse IgG(H+L) at dilution 1:1000 (green), and 0.2 ug Control Antibody. Cells were fixed with 90% MeOH.

Various lysates were subjected to SDS PAGE followed by western blot with 66912-1-Ig (CDC25C antibody) at dilution of 1:3000 incubated at room temperature for 1.5 hours.
