Background Information

A disintegrin and metalloproteinase with thrombospondin motifs 2 (ADAMTS-2) is a metalloproteinase that plays a key role in the processing of fibrillar procollagen precursors into mature collagen molecules by excising the amino-propeptide. ADAMTS-2 can, like the procollagen C-proteinases, be regulated by transforming growth factor- β 1 (TGF- β 1), with implications for mechanisms whereby this growth factor effects net increases in formation of extracellular matrix. Mutations in the ADAMTS-2 gene cause dermatosparaxis in human (dermatosparactic type of Ehlers-Danlos syndrome, also known as Ehlers-Danlos syndrome type VIIC). Human ADAMTS-2 has eight potential sites for Asn-linked glycosylation and other mammals (PMID: 16046392, 12646579).

Selected Validation Data

Various lysates were subjected to SDS PAGE followed by western blot with 84476-6-RR (ADAMTS2 antibody) at dilution of 1:10000 incubated at room temperature for 1.5 hours. This data was developed using the same antibody clone with 84476-6-PBS in a different storage buffer formulation.

Immunofluorescent analysis of (4% PFA) fixed A431 cells using ADAMTS2 antibody (84476-6-RR, Clone: 241860B8) at dilution of 1:250 and CoraLite®488-Conjugated Goat Anti-Rabbit IgG(H+L) (SA00013-2). This data was developed using the same antibody clone with 84476-6-PBS in a different storage buffer formulation.

Biacore interferometry (BLI) kinetic assays of 84476-6-RR against Human ADAMTS2 were performed. The affinity constant is 0.472 nM.
