Background Information

TRAIL, also known as CD253 or TNFSF10 (tumor necrosis factor superfamily member 10), is a typical death ligand $expressed \ on \ natural \ killer \ cells \ and \ cytotoxic \ T \ lymphocytes. This \ protein \ preferentially \ induces \ apoptosis \ in$ transformed and tumor cells, but does not appear to kill normal cells although it is expressed at a significant level in most normal tissues. TRAIL induces apoptotic cell death in cancer by binding to its functional death receptors, death receptor (DR) 4 (TNFRSF10A/TRAIL-R1) and DR5 (TNFRSF10B/TRAIL-R2) to activate the extrinsic apoptosis pathway. TRAIL also activates c-Jun N-terminal kinase (MAPK8/JNK) and the transcription factor nuclear factor-кВ (NFkB). The binding of this protein to its receptors has been shown to trigger the activation of MAPK8/JNK, caspase 8, and caspase 3.

Selected Validation Data

1x10^6 untreated or IFN-alpha treated human peripheral blood mononuclear cells were surface stained with 0.25 ug Anti-Human TRAIL/CD253 Rabbit Recombinant Antibody (98139-1-RR, Clone: 241419D2) and PE-Conjugated Goat Anti-Rabbit 1gG(H+L). Cells were co-stained with APC Anti-Human CD14. Cells were incubated with FC Receptor Block prior to fixing and staining. Cells were not fixed. This data was developed using the same antibody clone with 98139-1-PBS in a
