Background Information

Atg7 is an E1-like enzyme that is specifically involved in autophagosome formation and is essential for autophagy. As an autophagic-related protein it is required for linking to Atg12, Atg5 and Atg8, which are essential for Atg conjugation and autophagosome formation. Atg7 has been reported as an important regulator of autophagy with starvation-induced or chemotherapeutic agent treatment. The high expression level of ATG7 is related to the survival of patients with breast cancer. There are several isoforms of ATG7 protein ranged from 68 kDa to 78 kDa.

Selected Validation Data

Immunofluorescent analysis of (-20°C Methanol) fixed HepG2 cells using CoraLite®594 ATG7 antibody (CL594-67341, Clone: 2B5A10) at dilution of 1:200.

1X10⁶ Jurkat cells were intracellularly stained with 0.4 ug CoraLite®594 Anti-Human ATG7 (CL594-67341, Clone:2B5A10) (red), or 0.4 ug Mouse IgG2a Isotype Control (CL594-66360-2, Clone: K11A1B2A2) (blue). Cells were fixed with 4% PFA and permeabilized with Flow Cytometry Perm Buffer (PF00011-C).
